## **ERRATUM**

Please note the following correction.

In the December 1995 Report to the Integrated Waste Management Board, the Kettleman Hills Landfill (WDS ID Number 5D162008001) was erroneously included in Table III (Sites Identified with Waste Constituents Above Hazardous Waste Levels Outside the Waste Management Unit). Instead, it should have been included in Table VI (Sites Identified with No Waste Constituents Outside of the Waste Management Unit).

## ACKNOWLEDGEMENTS

This report was prepared based on work done by and with the support of the Regional Water Quality Control Board SWAT Program staff who supplied essential information and reviews. We extend particular gratitude to James M. Parsons, former SWAT Program Manager, who managed the program almost continuously until his retirement from the SWRCB in August, 1994.

## EXECUTIVE SUMMARY

In a 1993 Memorandum of Understanding, the State Water Resources Control Board (SWRCB) agreed to submit a comprehensive report on the Solid Waste Assessment Test (SWAT) Program to the California Integrated Waste Management Board (CIWMB). This report summarizes the work completed to date on the SWAT Program, and addresses both the impacts that leakage from solid waste disposal sites (SWDS) may have upon waters of the State and the actions taken to address such leakage.

In 1984, the Legislature passed a law requiring testing of water and air media at all solid waste disposal sites (Chapter 1532, Statutes of 1984) [See Appendix]. In particular regarding water testing, the law added Section 13273 to the Water Code, requiring the SWRCB to rank all solid waste disposal sites in groups of 150 each, according to the threat they may pose to water quality. The law requires the operators of each of the 150 sites in a given rank to submit a water quality "solid waste assessment test" (SWAT) report. In addition, the law requires the Regional Water Quality Control Boards (RWQCBs) to evaluate the reports for adequacy of the monitoring networks. If the monitoring networks are adequate, RWQCBs are to determine whether any hazardous waste has migrated into the water, notify the State Department of Toxic Substances Control (DTSC)<sup>1</sup> and the California Integrated Waste Management Board (CIWMB) of hazardous waste migration, and take appropriate remedial action.

RWQCBs approved a total of 528 reports or exemption questionnaires (for sites with undetermined leak status) in all ranks and waived a total of 16 reports from sites already known to leak. These 544 sites were predominantly from the lower ranks and therefore represented the SWRCB's and the RWQCBs' estimates of the sites most likely to have leaked hazardous wastes into the waters of the State. Of these 544 sites,

- 392 sites [72%] were found to have leaked waste constituents from the waste management unit.
  - o 33 of the 544 sites [6%] were classified as leaking wastes at concentrations exceeding hazardous levels.

---

<sup>1</sup> At the time the law was passed, DTSC was a Division within the Department of Health Services (DHS).

- o 276 of the 544 sites [51%] were determined to be leaking waste constituents above other "regulatory levels".
- o 83 of the 544 sites [15%] were determined to be leaking waste constituents above background levels but below any applicable "regulatory levels".
- 76 of the 544 sites [14%] were not known to be leaking.
- 76 of the 544 sites [14%] are undetermined with regard to their leakage status, in many cases because background water quality cannot be determined.

Thus, the percentage of sites found through the SWAT Program to be leaking waste constituents outside the limits of the landfill is between 72% (if all 76 "undetermined" sites are actually not leaking) and 86% (if all 76 "undetermined" sites are actually leaking).

Because of slight variations in RWQCBs criteria for determining beneficial uses of waters, the exact number of sites which have impacted beneficial uses has not been determined. Using certain assumptions, we estimate that, disregarding "undetermined" leak status sites, about 70% of the tested sites have impacted beneficial uses.

The results of the SWAT Program have particular bearing on the subject of landfill liner design. Specifically, the SWRCB's requirement to use composite liners (i.e., both clay and plastic as a single liner) for new or expanding municipal solid waste landfills has been controversial. Of the 290 sites for which the SWRCB has chemical constituent data, only 23 (8%) of these sites had even a partial liner. Most of the 23 sites' liners were clay-only, and none of the sites were completely composite-lined. The leakage results for partial or non-composite liners were similar to leakage results for unlined landfills, i.e. most leaked and some are unknown if they leak. Thus, the SWAT Program results strongly indicate that unlined and clay-lined landfill designs are not effective in preventing leakage.

Over half of the landfills "closed" longer than 30 years leaked in excess of "beneficial uses" criteria. The leakage data do not indicate when during the landfill's "lifetime" it began to leak; however the SWAT data show that landfills tend to leak even if they have not accepted waste for more than thirty years.

Available data indicate no apparent correlation between the percentage of landfills which leaked and any of the different site-specific factors checked, including depth to

ground water, average annual precipitation, waste acceptance rate, and rock type. Thus, information collected through the SWAT Program demonstrates that unlined or clay-lined landfills leak, regardless of factors such as climate or site-specific geology.

Corrective actions are either in progress or proposed at many of the leaking landfills. RWQCBs are requiring further investigations at most of the remaining sites in order to determine the full extent of constituent migration prior to implementing corrective action to address the leakage.

## PROGRAM BACKGROUND

### SWAT Legislation

In 1984, the Legislature passed a law requiring testing of water and air media at all solid waste disposal sites (Chapter 1532, Statutes of 1984) [See Appendix]. The law added Section 13273 to the Water Code, requiring the SWRCB to rank all solid waste disposal sites in groups of 150 each, according to the threat they may pose to water quality. The law requires the operators of each of the 150 sites in a given rank to submit a water quality "solid waste assessment test" (SWAT) report. The SWAT reports for each rank are due in consecutive years. In addition, the law requires the RWQCBs to evaluate the reports for adequacy of the monitoring networks. If the networks are adequate, the RWQCBs are to determine whether any hazardous waste has migrated into the water, notify the DTSC and the CIWMB of hazardous waste migration, and take appropriate remedial action.

### Terminology

For the purpose of this report, the terms listed below are defined as follows:

#### Solid Waste Disposal Site (SWDS):

The tract of land which is used or has been used for the disposal of solid waste. Usually referred to as a "landfill".

#### Facility:

An area of land which contains one or more SWDS(s). Facility includes areas outside of the SWDS which may be used for other purposes.

#### SWAT Site:

A facility which is on the Ranked SWAT List as adopted June 22, 1989.

# HISTORY OF SOLID WASTE DISPOSAL SITE REGULATION

## Siting and Design Requirements

- Pre-1972      Until about 20 years ago, landfill design in California for water quality protection was based on two major "principles". First, for hazardous wastes, it was thought that adequate containment capability would be provided by locating a site either on a clay bed a few tens of feet thick or on crystalline or shaley rock. Second, for non-hazardous wastes, it was thought that adequate containment capability would be provided by locating a site on a 5-foot thickness of dry underlying soil. The prevailing thought was that any fluid that leaked from the landfill would be cleansed during its passage through the soil or would be adequately attenuated before it could reach ground water and impact any beneficial uses.
- 1972            RWQCBs generally regulated landfills, based on these "principles". However, several publications in the late 1960's pointed out potential problems and suggested appropriate SWDS siting and management policies related to the types of wastes received. Accordingly, in 1972, the SWRCB adopted regulations governing discharges of waste to land [California Code of Regulations (C.C.R.) Title 23, Division 3, Chapter 15].
- 1984            Monitoring data in the late seventies (see next section) indicated that fluids leaked from landfills were reaching ground water. As a result, the SWRCB revised the Chapter 15 regulations in 1984 including specific siting and containment requirements for SWDSs.
- 1993            In response to federal Subtitle D requirements, the SWRCB adopted its Policy for Municipal Solid Waste Landfills (Resolution No. 93-62). This Policy requires new and expanding landfills to have composite (i.e., clay and plastic) liners.

## Water Quality Monitoring Requirements

- Pre-1972      Until about 20 years ago, analysis of water quality to detect impacts from landfills focused primarily on general minerals and aquatic biota

survival analyses, including major cations and anions, biological oxygen demand, chemical oxygen demand, and bacteria counts.

1972 The SWRCB adopted Chapter 15 regulations requiring only minimal ground water monitoring. A landfill's impact on water quality was generally determined by occasional sampling of a nearby well. The sampled wells were rarely designed for monitoring use; rather they were generally water production wells with multiple screened zones and high-volume pumps. Little was known regarding screen depths or site hydrogeology. As a result, most of this monitoring revealed little about any landfill leakage.

1984 An increased awareness of the adverse environmental and health effects caused by many common organic compounds prompted the inclusion of organic compounds in water quality analyses from landfills. These analyses indicated that volatile organic compounds (VOCs), particularly vinyl chloride, trichloroethylene, and tetrachloroethylene, were found in ground water near landfills. In addition, semi-volatile organic compounds (SVOCs) such as toluene, benzene, and xylene were detected in ground water near landfills. In many cases, these VOCs and SVOCs were detected at concentrations exceeding their Maximum Contaminant Levels or other regulatory level. The organic compounds were detected in ground water beneath both nonhazardous waste landfills (e.g., municipal solid waste landfills), and hazardous waste landfills.

The 1984 Chapter 15 revisions required landfill operators to prepare a monitoring plan for all active landfills; the decision as to whether to monitor an inactive landfill was at the discretion of the RWQCB, based on potential threat to water quality. Monitoring wells were to be designed specifically for the purpose of ground water monitoring. After the RWQCB approved the plan, the discharger was to establish monitoring points and start monitoring. By the time the SWAT Program started in 1986, few such monitoring programs had been established.

1991 Earlier findings from the SWAT program indicated that many landfills had impacted ground water. Furthermore, the use of gas chromatograph and mass spectrograph technologies led to a decrease in the detection limits of analytical methods. Analytical precision improved to commonly better than one part per billion and sometimes nearly one part per trillion. Toxicological research led state and federal agencies to set regulatory levels, such as the Maximum Contaminant Levels, frequently

below the one part per billion range. Chapter 15 was revised to allow clean-up levels no higher than the Maximum Contaminant Levels or other applicable health-based standards in 1991. The revisions included provisions requiring vadose zone monitoring, to allow for the earliest possible indication of a release from the landfill.

## PROGRAM TASKS

### Site Ranking

During 1985, candidate sites for the SWAT rank list were gathered from several sources. The major sources were:

- 1) SWRCB/RWQCB Waste Discharge System database,
- 2) California Integrated Waste Management Board listings,
- 3) Sites listed in County Solid Waste Management Plans,
- 4) Sites listed in California Department of Health Services reports from 1968 and 1973,
- 5) Sites listed by the South Coast Air Quality Management District,
- 6) An unpublished 1985 inventory by the Los Angeles County Engineer's office, and
- 7) Sites recommended by RWQCB staff but otherwise not on an existing list.

The SWRCB first adopted a SWAT rank list in December 1985. It was comprised of approximately 1,800 sites ranked according to their expected threat to water quality. RWQCB staff later determined that the original rank list contained some sites that were: 1) duplicated as another site name on the list, 2) proposed, but never operated, or 3) not actually subject to the SWAT legislation, such as wrecking yards, spill sites, and industrial surface impoundments. The RWQCBs did not require SWAT reports of this third category of sites once they determined that they were not subject to the SWAT legislation.

The rank list was revised in October 1986, December 1986, December 1987 and June 1989 to include additional sites and to delete sites that were determined to not be subject to the SWAT legislation. The current rank list (adopted June 22, 1989) contains 2,242 sites. Landfills constructed after June 1989 are not on the current list. Since the last re-ranking in 1989 and as work continued on the SWAT Program, RWQCBs designated a small number of additional sites on the rank list as not subject to SWAT.

Occasionally, a specific facility may have two or more distinct waste management units, primarily large industrial or military sites. Generally, the entire facility was

treated as a single entity, and only one SWAT report was submitted. In a few cases, the waste management units were listed in different ranks, and separate SWAT reports were submitted for the waste management units.

### Exemption Questionnaire

The SWAT legislation was amended in 1987 to permit site operators only in Ranks 3 and greater to submit a Solid Waste exemption questionnaire. The questionnaire allowed RWQCBs to exempt an operator of a site from submitting a full SWAT report provided that the following conditions were met: 1) the site capacity was less than 50,000 cubic yards; and 2) hazardous waste had not been discharged to the unit. Small sites in rural counties were typical candidates for exemption. *Exemption resulted in no monitoring data being submitted for the SWAT program to determine whether the landfill leaks.*

### Waiver of SWAT Reports

The SWAT legislation provides that a RWQCB may waive the submittal of a SWAT report if it determines from other information that hazardous wastes are already migrating into the waters of the State. *The issuance of a waiver means that the landfill leaks hazardous waste, based on other available data.*

### Review of SWAT Reports

Under SWAT legislation, RWQCB staff review SWAT reports and decide whether to accept the report as complete or to require the site operator to perform additional work. Initially, the acceptance criteria included the determination that the monitoring network complied with the requirements of Chapter 15, Article 5, thus minimizing the possibility of false leakage indication. In 1993, however, the acceptance criteria were revised such that SWAT reports were approved for sites that showed significant leakage regardless of the monitoring system's completeness. This allowed for quicker approval of reports and for fewer resources to be expended at this stage.

In an effort to expedite a cost-effective review of SWAT reports for facilities in the Department of Defense Environmental Restoration Program (DERP), many SWAT sites at military facilities were reviewed in conjunction with ongoing DERP activities. Funding for these efforts were through the Department of Defense/State Memorandum of Agreement, beginning with Fiscal Year 1991-92.

## Notification

Law requires RWQCBs to notify DTSC (formerly DHS) whenever: (1) the RWQCB waived the requirement for a SWAT report (i.e., site was known to leak), or (2) a SWAT report finding indicated hazardous waste leakage. In the case of waived sites, actions to address the leakage were generally being implemented with oversight by DTSC. For example, because DTSC monitors many Superfund site cleanups, it is already aware of their hazardous waste leakage status. In the case of federal military facilities, actions at the waived site are being addressed under the Department of Defense Installation Remediation Program.

## Follow-up Activities

There is no specific provision in the SWAT legislation for follow-up investigations to determine the magnitude of any identified leak or to design a cleanup program. These tasks are generally undertaken in compliance with requirements in Chapter 15 regulations. RWQCB actions on these matters are prioritized based on the leak's threat to water quality and impact on beneficial uses.

## Technical Guidance Manual

In 1988, the SWRCB produced a SWAT Technical Guidance Manual for use by RWQCB staff in reviewing SWAT reports, and by owners/operators in preparing SWAT reports. The manual recommended that the following basic information be in a SWAT report:

- 1) Description of the disposal site and its history.
- 2) Thorough description of the site hydrogeology.
- 3) Rationale for the location and design of all monitoring points.
- 4) Well logs and sample analysis data.
- 5) Interpretation of the data relative to hazardous waste leakage.
- 6) Certification of the preparer's credentials.

The manual emphasized the following:

- 1) Initial submittal of a SWAT Proposal or "Workplan" to the RWQCB containing the operator's plans for compliance with the SWAT law.
- 2) Establishment of a monitoring network that meets all requirements of California Code of Regulations, Title 23, Division 3, Chapter 15.

- 3) Either inclusion of upgradient monitoring points or acceptance of responsibility by the owner/operator for all pollutants detected through downgradient monitoring.
- 4) Sampling at least four different times over a year in order to ensure detecting any seasonal discharges.
- 5) Analysis of water quality samples for:
  - a) Volatile Organics (EPA 624)
  - b) Semi-volatile Organics (EPA 625)
  - c) ICAP Metals
- 6) Quality Control/Quality Assurance of all laboratory chemical analyses.

The SWAT Program focused on ground water monitoring. However, in cases where there was an apparent threat to surface water quality, surface water monitoring points were also to be established.

The SWAT legislation required vadose zone monitoring. RWQCBs often waived this requirement for sites where the waste was very close to or present in the ground water; that is, where little or no vadose zone existed, and where it was assumed that the ground water analysis would show any leakage. In the early part of the Program, RWQCBs often "waived" vadose zone monitoring because of a prevalent lack of understanding of the methods for installation and operation of lysimeters or related means for vadose zone monitoring.

In a few cases, a site was already being addressed as required by SWAT legislation through another program or action by the RWQCB. In those cases, RWQCBs could consider reports submitted for the other program or action to be equivalent to a SWAT report. Examples include submittals of Hydrogeological Assessment Reports (HARs) for compliance with the Toxic Pit Cleanup Act, reports prepared in response to a Cleanup and Abatement Order, or monitoring under the core regulatory waste discharge requirement program for waste discharges to land (Chapter 15).

## BUDGETARY CONSTRAINTS

When the SWAT Program was initiated in 1986, it was adequately funded, and RWQCBs were able to complete their review of SWAT reports in a timely manner. However, beginning in 1988, in response to a General Fund cut, the SWRCB had to reduce SWAT funding significantly. As a result, a backlog of submitted SWAT reports began to grow. In response, RWQCB staff eliminated their reviews of SWAT workplans and focused exclusively on SWAT reports and questionnaires. SWAT funding was cut completely during Fiscal Year 1991-92.

Late in 1992, the Legislature appropriated \$2,500,000 to the SWRCB from the Integrated Waste Management Account, which primarily funded the CIWMB. This appropriation was to eliminate the backlog of unreviewed Ranks 1 through 5 SWAT reports only. The funding was allocated as follows: 30% to Fiscal Year 1992-93, 60% to Fiscal Year 1993-94, and 10% to Fiscal Year 1994-95.

## CURRENT SWAT STATUS

The SWAT report status for each of the 750 Ranks 1 through 5 sites is displayed in Table I. Following is a description of the SWAT report status categories:

REPORT APPROVED	RWQCB has approved the SWAT report.
EXEMPTED BY QUESTIONNAIRE (UNDETERMINED IF LEAKED)	Operator has submitted a SWAT Questionnaire which indicates that the site meets statutory criteria, (specifically, site no larger than 50,000 cubic yards and no hazardous waste disposal therefore no determination of leakage must be made).
WAIVED FROM SWAT (KNOWN TO LEAK)	RWQCB staff has determined that hazardous waste leakage has occurred, and a SWAT report is not required.
UNDER REVIEW	RWQCB is currently reviewing the report.
RETURNED FOR ADDITIONAL INFORMATION	RWQCB has begun review of the report but has returned it for additional information.
PENDING REVIEW	RWQCB has received the report but has not begun review of the report.
LATE	RWQCB has requested a SWAT report but it was not received before the submittal deadline.
NOT YET NOTIFIED	RWQCB has not yet requested a SWAT report submittal.
POSSIBLY NOT SWAT	The site possibly may not be subject to the SWAT Program.
NO JURISDICTION	RWQCB has determined that the site is not actually subject to the SWAT Program. (Sites are generally covered under

another program, such as Toxic Pits Cleanup Act, or Spills, Leaks, Investigation, and Cleanups.)

**DUPLICATE SITE**            The site is listed more than once in the ranked list.

### Ranks 1 through 5

As of the date of this report, operators of 562 of the 750 sites in Ranks 1 through 5 have submitted a SWAT report or exemption questionnaire (undetermined leak status). RWQCBs have waived an additional 16 sites from SWAT requirements (because they are known to leak). Of the 562 reports or questionnaires, 513 have been approved. Forty-nine (49) reports: (1) are under review, (2) were returned for additional information, or (3) are pending review. Operators for 136 sites are late in submitting their reports or have not been notified yet, and operators for 36 sites will not submit a report because the sites are: (1) duplicate sites, (2) possibly not SWAT sites, or (3) not under SWAT jurisdiction. Table I displays the status for the 750 sites in Ranks 1 through 5.

### Ranks 6 or greater

In addition to sites in Ranks 1 through 5, some RWQCBs have performed work on sites in Rank 6 or greater. As of the date of this report, RWQCBs have approved eleven SWAT reports and four exemption questionnaires (undetermined leak status) from Rank 6 or greater.

## LEAKAGE CHARACTERIZATION

Of the 544 sites<sup>2</sup> whose SWAT reports or Questionnaires that are approved or waived (known to leak), between 392 and 468 (i.e., 72% to 86% of the total) sites were found to have waste constituents outside the limits of the waste management unit (Table II). Tables III, IV, and V identify specific sites and the degree of leakage. Table VI shows those sites not known to leak. Table VII shows those sites where leakage status is undetermined.

---

<sup>2</sup> The total number of SWAT sites addressed in this and the following sections is derived from the following:

Approved reports or exemption questionnaires from Ranks 1 through 5:	513
Waived sites from Ranks 1 through 5:	15
Approved reports or exemption questionnaires from Ranks 5 or greater:	<u>16</u>
	544

Waste constituents in the surrounding media *exceed hazardous waste concentrations* at only 33 sites. Rather, at the vast majority of the sites, waste constituents in the surrounding media *exceed other regulatory levels* or *exceed background levels only*. The following three sections discuss the three categories of leakage.

#### A. Waste Constituents at Hazardous Waste Levels

The term "hazardous waste" is defined similarly although not identically in both Health and Safety Code Section 25117 and Public Resources Code Section 40141. In determining whether any detected leakage is hazardous, the RWQCB must apply the definitions cited above, as well as the criteria contained in DTSC's regulations (CCR, Title 22, Division 4.5, Chapter 11). These criteria define whether a substance is hazardous by virtue of its toxicity, ignitability, reactivity, or corrosivity. In addition, the regulations contain lists of persistent and bioaccumulative toxicity concentration limits for a limited number of inorganic and organic chemicals. Any substance that exceeds any of the stated criteria must be considered hazardous. If analyses of SWAT report sampling data indicate any chemical concentrations in the surrounding media above the established hazardous waste concentration levels, the media where leakage was detected is classified as hazardous waste.

Thirty-three (33) sites were classified as leaking wastes such that the concentrations in the media are considered to be hazardous (see Table III). Of these 33 sites, RWQCBs waived 16 sites from submitting a SWAT report, based on existing information showing the site to be leaking at hazardous waste levels. At the remaining sites, SWAT report data indicated that the types of leakage were heavy metals, VOCs, or, in one case, a pH level constituting hazardous waste.

Many SWAT sites are leaking waste constituents which have impacted or may adversely impact water quality, but which are detected at concentrations which do not exceed hazardous waste criteria, as discussed above. A constituent's concentration tends to vary inversely with the distance from the waste management unit. That is, in general, the farther the monitoring point is from the waste management unit, the less likely that the sampled medium is at hazardous waste concentrations. Thus, a waste management unit may leak hazardous waste (e.g., heavy metals); however, the leakage as detected at the monitoring point may be classified as non-hazardous waste due to its relatively low concentration. As a result, the SWAT Program uses two additional leakage categories to evaluate adverse water quality effects from waste constituents not classified as hazardous waste. These are Waste Constituents above "Regulatory Levels", and Waste Constituents below "Regulatory Levels", discussed below.

## B. Waste Constituents Above "Regulatory Levels"

This category is used for those reported analyses that do not show chemical concentrations in the surrounding media above hazardous levels as discussed above, but which do show concentrations above one of the following water quality standards:

- 1) Drinking Water Standards (California and Federal) Maximum Contaminant Levels (**MCLs**). Includes both primary and secondary DTSC and USEPA MCLs as well as USEPA MCL goals.
- 2) California Recommended Public Health Level (**RPHL**), Department of Health Services
- 3) California State Action Levels for toxicity or taste & odor, (DHS).
- 4) Other taste and odor thresholds.
- 5) Health Advisories or Suggested No-Adverse-Response Levels (**SNARLS**) for toxicity other than cancer risk by USEPA or the National Academy of Sciences.
- 6) USEPA Integrated Risk Information System (**IRIS**) Reference Dose as a Water Quality Criterion.
- 7) One-in-a-Million Incremental Cancer Risk Estimates for Drinking Water.
  - a) Cal/EPA Cancer Potency Factor.
  - b) USEPA Integrated Risk Information System (IRIS).
  - c) USEPA Health Advisory or SNARL.
  - d) National Academy of Sciences Drinking Water and Health.
- 8) California Proposition 65 Regulatory Level as a Water Quality Criterion.
- 9) Agricultural Water Quality Goals.

The concentration limits for each of the above goals are tabulated in A Compilation of Water Quality Goals, a staff report prepared by Dr. Jon Marshack of the Central Valley Regional Water Quality Control Board.

Two hundred seventy-six (276) sites were determined to be leaking waste constituents above "regulatory levels" but below hazardous waste levels (see Table IV). Most of these sites leaked VOCs and SVOCs, primarily trichlorethylene, benzene, vinyl chloride, and tetrachloroethylene. Arsenic, lead, and cyanide were detected at approximately 15% of these sites. At only a few sites (4%), general minerals (e.g. iron and manganese) were detected above "regulatory levels".

### C. Waste Constituents Above Background but Below "Regulatory Levels"

This category is used for those reported analyses indicating leakage from the site, but in concentrations below any applicable "regulatory levels". This category includes many naturally-occurring constituents (e.g., sodium and bicarbonate), which indicate an elevated concentration downgradient from the landfill. In addition, this category includes man-made constituents (primarily organics) for which there are no established "regulatory levels".

Eighty-three (83) sites were determined to be leaking waste constituents below "regulatory levels", if any exist for that constituent (see Table V). Most sites in this category indicated leakage of VOCs and SVOCs, but at concentrations below "regulatory levels". However, in cases where background concentrations of naturally-occurring constituents were known, concentration increases of these constituents found downgradient from the landfills indicated that the landfills were impacting water quality.

Table VI lists the 76 [14%] sites at which waste constituents were not found in media near the waste management unit. Table VII lists the 76 [14%] sites whose leakage status is undetermined. A frequent cause of undetermined leakage status is that background water quality is not well known or is impacted by an adjacent source upgradient of the landfill, and therefore the exact source of constituents found in the waters near the site is unknown.

## CHEMICAL CHARACTERIZATION OF SITE LEAKAGE

RWQCB staff have provided information on the specific type of constituent leakage for over half of the 544 approved, waived (known to leak), and exempted (leakage status undetermined) sites (See Table VIII). The table shows the maximum concentrations of 60 constituents in five media (background ground water, surface water, ground water, vadose zone, and leachate). In addition to the 60 constituents, RWQCB staff have provided information on other constituents which they considered to be a significant threat to waters of the State.

In addition to information on leakage category supplied by RWQCB staff, SWRCB staff used a computer program to classify leakage by comparing constituent values against "regulatory levels". When the program found that organic compounds were detected but not at concentrations above "regulatory levels", it identified the site as leaking, based upon the premise that organic compounds occur very rarely in background ground water analyses. As a result of the computer scan, some sites may be identified as leaking even though the submitted SWAT report states that an upgradient source is the cause of the exceedance. Table IX displays the type of constituent (i.e., general minerals, metals, and organic compounds) and number of occurrences for sites leaking above "beneficial use" criteria limits.

Organic compounds are the most prevalent constituents found in all three leakage categories. The most common constituents, in order of decreasing occurrence, are trichloroethylene, benzene, vinyl chloride, tetrachloroethylene, and dichloromethane. Figure 1 displays the breakdown pathways for tetrachloroethane and tetrachloroethylene. It is possible that the high occurrences of trichloroethylene and vinyl chloride can partly be attributed to decomposition of tetrachloroethylene.

Arsenic, lead, and sodium were the most frequently detected metals. General minerals rarely have designated regulatory levels; exceptions include chloride (secondary MCLs) and nitrate (primary MCLs). As a result, general minerals were most prevalent in the leakage below "regulatory levels" category.

## HAZARDOUS WASTE PRESENCE IN LANDFILLS

Most of the landfills investigated under the SWAT Program received primarily municipal solid waste (MSW), and to a lesser extent, nonhazardous industrial waste. MSW contains relatively small amounts of hazardous waste, called "household hazardous waste". Less than ten SWAT sites were permitted to receive hazardous waste. However, because SWAT data shows that at a number of sites hazardous waste has migrated into the surrounding media, it is possible that more than the ten sites received more hazardous waste than the incidental amounts typically found in MSW. It is also possible that some nonhazardous constituents break down into hazardous constituents under prevailing conditions within the landfill.

## CONSTITUENT LEAKAGE CATEGORIES COMPARED WITH OTHER SITE-SPECIFIC DATA

Chemical constituent data were available for only 270 of the total 544 approved, waived, or exempted SWAT sites. Sites for which actual chemical constituent data

were available, were evaluated for any trends with respect to site-specific information such as climate and geology. Only those sites for which chemical constituent data are available, and for which the leakage exceeded "beneficial use" criteria, described in a previous section, were included in these comparisons.

Tables X through XIV display the specific constituent leakage compared with other site-specific data, including depth to ground water, average annual precipitation, and length of time since closure. Figures 2 and 3 present this information in graphical format. There are no apparent correlations regarding the above site-specific parameters and the percentage of landfills which are leaking. Specific discussions regarding the site-specific parameters follow.

#### Depth to Ground Water (Table X)

At the tested SWAT sites, ground water ranged from less than ten feet to over five hundred feet deep. Ground water depth was thirty feet or less at almost half of the sites for which depth was known. There was no apparent correlation between the percentage of landfills which leaked in excess of "beneficial use" criteria and the depth to ground water. The data in Table X indicate that unlined or clay-lined landfills leak regardless of depth to ground water.

#### Average Annual Precipitation (Table XI)

Average annual precipitation ranged from less than five inches to more than 50 inches per year. Over three-quarters of the sites were in the 10 to 40 inch per year precipitation category. There was no apparent correlation between the percentage of landfills which leaked in excess of "beneficial use" criteria and the average annual precipitation. The data in Table XI indicate that unlined or clay-lined landfills leak regardless of precipitation.

#### Waste Acceptance Rate (Table XII)

The waste acceptance rate ranged from a few sites which accept less than 10 tons per day to sites accepting more than 1000 tons per day. While it may appear that there is an upward trend in percent leaking as waste acceptance increases, it should be noted that the data are sparse and that, for example, the percentage of leaking landfills accepting between 300 and 400 tons per day is similar to the percentage of leaking landfills accepting between 0 and 10 tons per day. Thus, there is no reliable correlation between waste acceptance rate and the percent of unlined or clay-lined landfills which leaked in excess of "beneficial use" criteria.

### Years From Last Waste Acceptance (Table XIII)

Of the sites for which data on the "years since last waste acceptance" are available, almost half were "closed" (engineered caps were generally never installed) between ten and twenty-five years ago.

One significant finding of this comparison is that five of the eight (63%) of the sites "closed" longer than 30 years leaked in excess of "beneficial uses" criteria. The thirty-year time period is of interest in that federal regulations require maintenance of closed landfills only for thirty years, whereas the SWRCB requires the landfill to be maintained, monitored, and remediated if necessary for as long as the wastes pose a threat to water quality. The leakage data do not indicate when during the landfill's "lifetime" it began to leak; however, the SWAT data show that unlined or clay-lined landfills tend to leak even if they have not accepted waste for more than thirty years.

### Facility Type (Table XIV)

The facility type indicates current facility designation only, and does not reflect any previous classifications. The facility may include several SWDSs. In general, only one SWAT report was submitted for each facility. There was no apparent correlation between facility type and the percentage of landfills which leaked in excess of "beneficial uses" criteria.

Over two-thirds of the sites are classified as Class III solid waste disposal sites in the database. Class III is the classification of a landfill that can accept nonhazardous solid waste (including municipal solid waste), according to 1984 Chapter 15. Sixty-nine (71%) of currently-classified Class III landfills leaked in excess of these criteria.

Chemical data were available for three facilities classified as Class I under Chapter 15. These were old military or large industrial sites which included unlined disposal areas or poorly-lined surface impoundments.

### Other Site-Specific Parameters

Other site-specific parameters were checked relative to the percentage of landfills which leaked in excess of "beneficial use" criteria, but no apparent trends were found. These parameters included: site geology (rock type), presence of a liner, current operating status, and owner/operator type.

Site Geology: The site's rock type was classified as Quaternary alluvium, marine sediments, weathered bedrock, or "other". The percentage of landfills leaking above "beneficial use" criteria did not vary by rock type.

Presence of a Liner: Since 1993, the SWRCB has required new or expanding MSW landfills to have a composite (i.e., clay and plastic) liner. None of the SWAT sites had a composite liner throughout the entire area where waste has been emplaced. Only 23 of the 290 (8%) SWAT sites for which the SWRCB has chemical constituent data had even a partial liner, and most of these partial liners were non-composite (e.g., clay only). Therefore, landfill leakage detected through the SWAT Program has primarily originated from unlined, but also from clay-lined, landfills. There was no apparent difference in leakage between unlined and non-composite lined sites.

Current Operating Status: One hundred twenty-one landfills [45%] were operating. There was no apparent relationship between a site's operating status and its leakage status. Seventy percent of the operating sites leaked in excess of "beneficial use" criteria, as opposed to seventy-one percent of the non-operating sites.

Owner/Operator Type: There were 143 government-owned sites and 74 privately-owned sites in the data set. There was virtually no difference in leakage, as 70% of the publicly-owned landfills leaked in excess of "beneficial use" criteria, as did 72% of the privately-owned landfills.

## IMPACT OF LEAKAGE ON QUALITY AND BENEFICIAL USES OF WATERS

All RWQCBs have adopted Water Quality Control Plans (**Basin Plans**) which identify beneficial uses of surface and ground waters in basins within the Regions. Generally, unless specifically noted otherwise, ground water beneficial uses include at least the following designations:

**MUNICIPAL** Municipal and domestic supply. Includes normal domestic community uses, through both municipal water supply systems and individual systems.

**AGRICULTURAL** Agricultural supply. Includes crop and pasture irrigation, stock watering, support of vegetation for range grazing, and all such uses which support farming and ranging operations.

**INDUSTRIAL** Industrial Service Supply. Includes uses which do not particularly depend on water quality, such as mining, cooling water supply, hydraulic conveyance, gravel washing, fire protection, and oil well pressurization.

In 1988, the SWRCB adopted Resolution No. 88-63, the "Sources of Drinking Water" policy. This policy specifies that, except under specifically defined circumstances, all surface and ground waters of the State are to be protected as existing, or potential sources of municipal and domestic supply, unless this beneficial use is explicitly de-designated in a water quality control plan. Specific circumstances for de-designation include waters with existing high TDS concentrations (greater than 3000 mg/l), low sustainable yield (less than 200 gallons per day for a single well), waters within particular municipal, industrial, and agricultural wastewater conveyance and holding facilities, and regulated geothermal ground waters. The application of one or more of these exemptions to remove the municipal or domestic supply designation for a particular body of water requires a formal Basin Plan amendment, a public hearing by the appropriate RWQCB, and approval by the SWRCB.

We have not ascertained an exact number of leaking SWAT sites that have impacted beneficial uses of the waters of the State because of the slight variations in RWQCBs' criteria for determining impacts on beneficial uses of the waters of the State. A typical approach of a RWQCB may be to consider that when USEPA primary or secondary MCLs, DHS primary or secondary MCLs, DHS Toxicity Action Levels or Proposition 65 levels have been exceeded, the beneficial uses of the water have been impacted. Using these "beneficial use" criteria, we have determined that approximately 70% of the 270 SWDSs for which chemical data are available have impacted beneficial uses.

Instances where degradation of the ground water to the point of impacting existing drinking water wells are rare. To date, of the 392 sites where waste constituents have been detected outside the waste management unit, seven sites were found to have impacted drinking water wells. Continued uncontrolled releases from the landfills, however, would likely lead to more impacted drinking water wells. The releases in ground water may impact future probable beneficial uses as well.

## COMPLETED OR PROPOSED REMEDIAL ACTIONS AT LEAKING LANDFILLS

Remedial actions are underway or proposed at many of the sites identified through the SWAT Program to be leaking. At many sites, additional investigation is underway to

determine the full extent of pollution prior to implementing remedial actions. In a few cases, subsurface pollution at low level concentrations warrants further investigation to determine whether the pollution is from the landfill or from another nearby source. These types of investigation fall under verification monitoring in Chapter 15.

Remedial actions range from initiating verification monitoring (generally at sites where non-organic constituents are only slightly above background levels) to installation of ground water or gas extraction wells or slurry walls around the perimeter of the site.

RWQCBs, particularly those in the southern, more arid portions of the State, have noted that landfill gas (primarily VOCs) emanating from a SWAT site has affected the surrounding media. Evidence of landfill gas impacting ground water is supported by the relative absence of leachate indicators (e.g., chlorides, iron, and carbonates) in the ground water, and by the presence of VOCs in upgradient locations where no other source is suspected. Gas extraction systems are being designed or are in place at most of the sites with VOCs where landfill gas impacts are suspected.

## RECOMMENDATIONS RELATIVE TO LANDFILL DESIGN AND MONITORING

As discussed in the section comparing leakage with site-specific data, landfill leakage detected through the SWAT Program has primarily originated from unlined, but also from clay-lined, landfills. These results support the need for adequate landfill design, including the SWRCB's requirements for composite liners for new and expanding MSW landfills.

A coordinated investigation between the RWQCB and the Local Enforcement Agency (LEA) should commence when VOCs have been detected in the ground water or vadose zone at both upgradient and downgradient sampling points. The investigation might include landfill gas monitoring to determine the landfill gas composition and amount, vadose zone monitoring to verify the absence of leachate, better characterization of the waste for both constituents and degree of saturation, and characterization of the subsurface geology. Using the information from this investigation, a clearer evaluation of the extent to which landfill gas is impacting ground water, and the extent to which landfill gas control can be expected to improve ground water quality, can be made. A coordinated investigation will also help ensure that any gas system installed as a result of the investigation will meet both water quality and health and safety needs.

Because water contributes to both sources of landfill leakage, namely leachate and landfill gas, it follows logically that infiltration of water into landfills should be reduced in order to minimize leakage. Accordingly, grading of the landfill surfaces to divert rainwater away from the waste management unit should continue to be required. Similarly, excessive use or ponding of dust control water should continue to be discouraged. In addition, materials used for intermediate and final covers should be sufficiently impermeable to prevent excessive percolation of water into the waste.

SWAT investigations have detected the presence of hazardous constituents at sites that were not permitted to accept hazardous waste. Load checking programs were required in 1984 by Chapter 15. Screening of incoming loads at the landfill entrance and at the working face should continue to be implemented to prevent unintentional acceptance of hazardous waste.

## CONCLUSIONS

The results of the SWAT Program to date offer significant data relevant to several current issues in the regulation of landfills for water quality protection. Three primary conclusions can be drawn from the SWAT data.

- o There is clearly a need for well-designed composite liners and leachate collection systems at new and expanding MSW landfills, in order to protect water quality. This need exists regardless of climate and site hydrogeology considerations.
- o Continued restriction on disposal of hazardous or designated wastes at unlined or clay-lined facilities is necessary to protect water quality.
- o A long (greater than thirty years) post-closure maintenance period is necessary to protect water quality at many landfill sites. Post-closure maintenance should continue to include ongoing water quality monitoring.

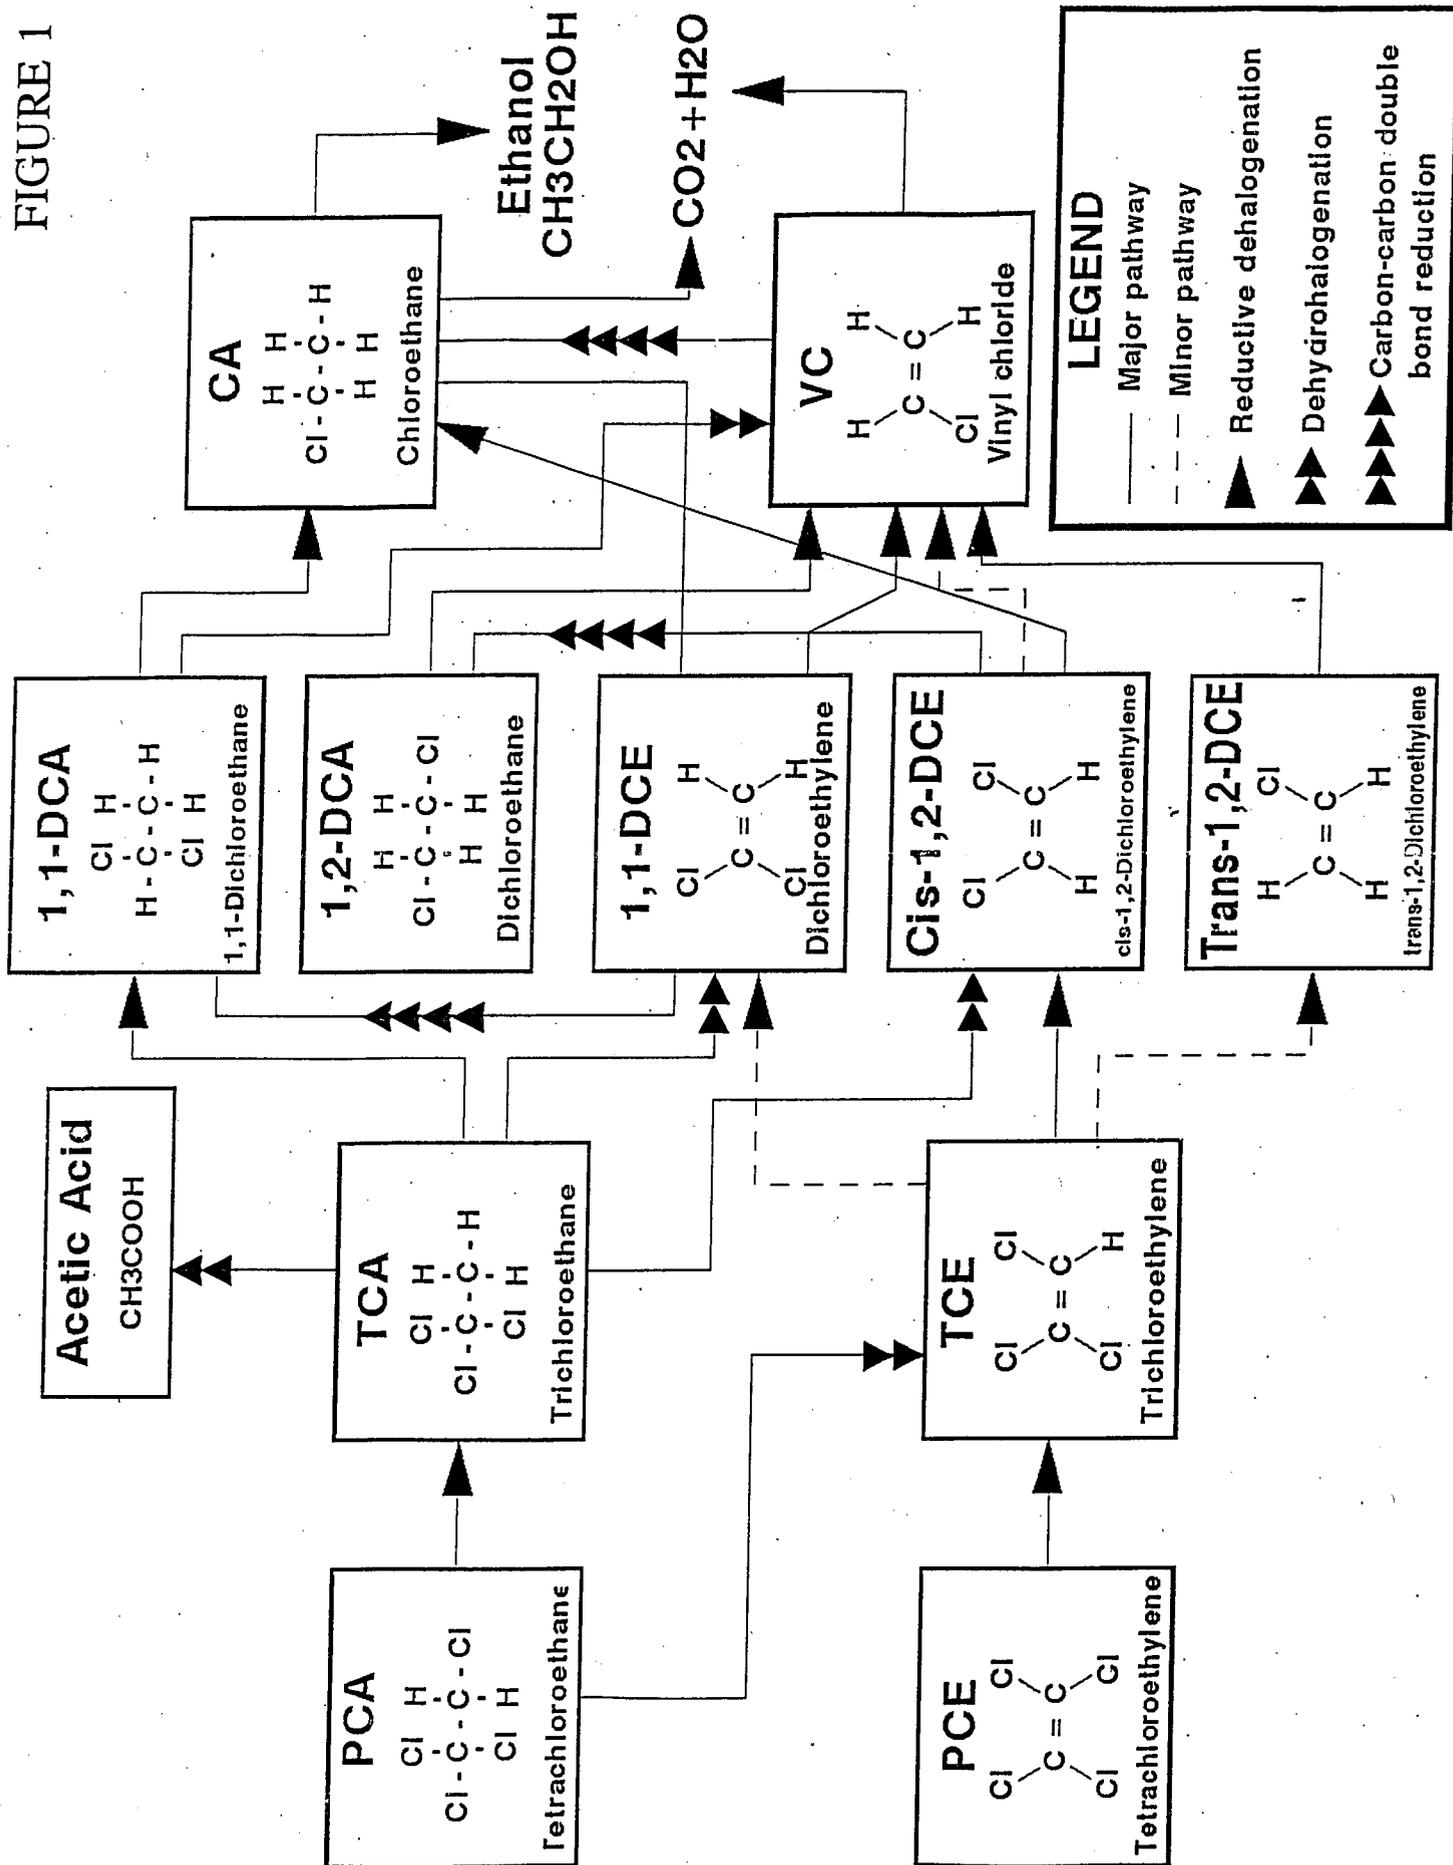

Also, while not directly addressed through the SWAT Program, it is nevertheless evident that efforts to minimize the infiltration of moisture into unlined or clay-lined landfills should be continued. This should apply to both operating and closed landfills, in order to minimize leachate and gas generation and thus protect water quality.

We expect that further review of SWAT reports for higher-rank sites would show the same basic trend of landfill leakage. However, the overall percentage of leaking sites would probably decrease somewhat, because the higher-rank sites are expected to pose

a lower threat to ground water quality. Should the SWAT Program receive additional funding allowing RWQCBs to review reports from Ranks 6 and greater, it would be possible to determine whether there is any effect on overall landfill leakage rates from the inclusion of lower-risk sites.

SWAT LEGISLATION

## SWAT LEGISLATION

§13273.

(a) The state board shall, on or before January 1, 1986, rank all solid waste disposal sites, as defined in Section 66714.1 of the Government Code, based upon the threat which they may pose to water quality. On or before July 1, 1987, the operators of the first 150 solid waste disposal sites ranked on the list shall submit a solid waste water quality assessment test to the appropriate regional board for its examination pursuant to subdivision (d). On or before July 1 of each succeeding year, the operators of the next 150 solid waste disposal sites ranked on the list shall submit a solid waste water quality assessment test to the appropriate regional board for its examination pursuant to subdivision (d).

(b) Before a solid waste water quality assessment test report may be submitted to the regional board, a registered geologist, registered pursuant to Section 7850 of the Business and Professions Code, a certified engineering geologist, certified pursuant to Section 7842 of the Business and Professions Code, or a civil engineer registered pursuant to Section 6762 of the Business and Professions Code, who has at least five years' experience in groundwater hydrology, shall certify that the report contains all of the following information and any other information which the state board may, by regulation, require:

(1) An analysis of the surface and groundwater on, under, and within one mile of the solid waste disposal site to provide a reliable indication whether there is any leakage of hazardous waste.

(2) A chemical characterization of the soil-pore liquid in those areas which are likely to be affected if the solid waste disposal site is leaking, as compared to geologically similar areas near the solid waste disposal site which have not been affected by leakage or waste discharge.

(c) If the regional board determines that the information specified in paragraph (1) or (2) is not needed because other information demonstrates that hazardous wastes are migrating into the water, the regional board may waive the requirement to submit this information specified in paragraphs (1) and (2) of subdivision (b). The regional board shall also notify the Department of Toxic Substances Control, and shall take appropriate remedial action pursuant to Chapter 5 (commencing with Section 13300).

(d) The regional board shall examine the report submitted pursuant to subdivision (b) and determine whether the number, location, and design of the wells and the soiling testing could detect any leachate buildup, leachate migration, or hazardous waste migration. If the regional board determines that the monitoring program could detect the leachate and hazardous waste, the regional board shall take the action specified in subdivision (e). If the regional board determines that the monitoring program was inadequate, the regional board shall require the solid waste disposal site to correct the monitoring program and resubmit the solid waste assessment test based upon the results from the corrected monitoring program.

(e) The regional board shall examine the approved solid waste assessment test report and determine whether any hazardous waste migrated into the water. If the regional board determines that hazardous waste has migrated into the water, it shall notify the Department of Toxic Substances Control and the California Toxic Substances Control and the California Integrated Waste Management Board and shall take appropriate remedial action pursuant to Chapter 5 (commencing with Section 13300).

(f) When a regional board revises the waste discharge requirements for a solid waste disposal site, the regional board shall consider the information provided in the solid waste assessment test report and any other relevant site-specific engineering data provided by the site operator for that solid waste disposal site as part of a report of waste discharge.

>

**§13273.1.**

(a) Except as provided in subdivision (b), an operator of a solid waste disposal site may submit a solid waste assessment questionnaire to the appropriate regional board at least 24 months prior to the site's solid waste water quality assessment test due date as established pursuant to Section 13273. The regional board shall require the operator to submit any additional information, as needed, or require onsite verification of the solid waste assessment questionnaire data in order to render a decision pursuant to subdivision (c).

(b) Any solid waste disposal site which is larger than 50,000 cubic yards or is known or suspected to contain hazardous substances, other than household hazardous wastes, shall be prohibited from submitting a solid waste assessment questionnaire under this section.

Copyright 1996 The Bureau of National Affairs, Inc.

(c) The regional board shall complete a thorough analysis of each solid waste assessment questionnaire submitted pursuant to this section by a date 18 months prior to the solid waste assessment test due date. Based upon this analysis, the regional board shall determine whether or not the site has discharged hazardous substances which will impact the beneficial uses of water. If the regional board determines that the site has not so discharged hazardous substances, the regional board shall notify the operator that the operator is not required to prepare a solid waste water quality assessment test pursuant to Section 13273.

(d) If the regional board does not make the determination specified in subdivision (c), the operator shall submit all, or a portion of, a solid waste water quality assessment test. The regional board shall notify the operator of this determination and indicate if all, or what portion of, a solid waste water quality assessment test shall be required. The operator shall submit the solid waste water quality assessment test, or a portion thereof, by the date established pursuant to Section 13273.

(e) The state board shall develop a solid waste assessment questionnaire and guidelines for submittal no later than three months after the effective date of this statute adding this section. The questionnaire shall contain, but not be limited to, a characterization of the wastes, size of the site, age of the site, and other appropriate factors.

(f) Those operators of solid waste disposal sites listed by the state board pursuant to Section 13273 in Rank 3 and seeking an exemption under this section shall submit their solid waste assessment questionnaire no later than July 1, 1988. If the regional board does not make the determination specified in subdivision (c), the regional board shall require the operator to submit all, or a portion of, a solid waste water quality assessment test by July 1, 1990.

>

§13273.2.

Notwithstanding subdivision (b) of Section 13273.1, a regional board may reevaluate the status of any solid waste disposal site ranked pursuant to Section 13273, including those sites exempted pursuant to Section 13273.1, and may require the operator to submit or revise a solid waste water quality assessment test after July 1, 1989. The regional board shall give written notification to the operator that a solid waste assessment test is require and the due date. This section shall not require submittal of a solid waste water quality assessment test by a

Copyright 1996 The Bureau of National Affairs, Inc.

date earlier than established in accordance with Section 13273.

>

**§13273.3.**

As used in Sections 13273, 13273.1, and 13273.2, "operator" means a person who operates or manages, or who has operated or managed, the solid waste disposal site. If the operator of the solid waste disposal site no longer exists, or is unable, as determined by the regional board, to comply with the requirements of Section 13273, 13273.1, or 13273.2, "operator" means any person who owns or who has owned the solid waste disposal site.

>

**§13273.5.**

Notwithstanding Section 13273, a small city which operates a Class III solid waste disposal site is not required to submit a solid waste water quality assessment test report pursuant to Section 13273 if the city has a population of less than 20,000 persons, the solid waste disposal site receives less than 20,000 tons of waste per year, the water table of the highest aquifer under the disposal site is 250 or more feet below the base of the disposal site and the water in the highest aquifer is not potable, and the site receives less than an average of 12 inches of rainfall per year.

This section applies only if the disposal site is operational and has been granted all required permits as of January 1, 1991, if the site is located in Kings County, and if the city has completed an initial solid waste water quality assessment test and a solid waste air quality assessment test which establish that no significant air or water contamination has occurred, and, in that event, the city shall be exempted from conducting further assessment tests for seven years, or any longer time specified by the regional board, after the date of the initial assessment tests.
